NASA SBIR 2021 Phase I Solicitation

H6.04 Model-Based Systems Engineering for Distributed Development

Lead Center: ARC

Scope Title:
Model-Based Systems Engineering for Distributed Development

Scope Description:
Systems Engineering technology is both a critical capability and a bottleneck for NASA human exploration development. NASA looks to a sustainable return to the Moon to enable future exploration of Mars, components such as Lunar Gateway and Artemis will require partnerships with a wide variety of communities. Building from the success of the international partnerships for International Space Station (ISS), space agencies from multiple governments are looking for roles on the Gateway. A particular focus has been made to include the rapidly growing commercial space industry to provide an important role in supporting a sustained presence on the Moon. All of these potential partners will have their own design capabilities and their own development processes and internal constituencies to support. Integrating and enabling disparate systems built in different locations by different owners to all work cohesively together will require a significant upgrade to the core-systems engineering capabilities.

In the last decade, Model-Based Systems Engineering (MBSE) technology has matured as evidenced by the development of Systems Modeling Language (SysML) tools and frameworks that support engineers in development efforts from requirements through hardware and software implementation. MBSE holds considerable promise for accelerating, reducing overhead labor, and improving the quality of systems development. However, a remaining bottleneck is the coordination and integration of system development across distributed organizations, such as the multiple partners developing Lunar Gateway and eventual Mars exploration. This subtopic seeks technology to fill this gap.

Areas of particular need include:

- Methodologies that support integration among tools and exchange of information between multidisciplinary artifacts using automated intelligent reasoning.
- The definition of open interface standards and tools to enable inspection of distributed models across engineering domains.
- Tools or systems that allow models to be shared across development environments and trace the resulting system model back to contributions from multiple partners while maintaining information security.
Modeling visualization environments that facilitate user interaction from multiple stakeholders perspectives with varying expertise in MBSE.

Executable requirements specification with precise semantic links disparate development sources.

Expected TRL or TRL Range at completion of the Project: 4 to 6

Primary Technology Taxonomy:
Level 1: TX 11 Software, Modeling, Simulation, and Information Processing
Level 2: TX 11.2 Modeling

Desired Deliverables of Phase I and Phase II:

- Prototype
- Software

Desired Deliverables Description:

Phase I: Prototype software to demonstrate proof of concept.

Phase II: Functional software that is ready to be tested in an operational environment by end users.

State of the Art and Critical Gaps:

For distributed development, the state of the art tends to be laboriously negotiated interface control documents and manual integration processes that are inherently slow and labor intensive. In an effort to overcome these challenges, MBSE and SysML in particular has seen significant adoption at NASA (Gateway, Resource Prospector, Europa Clipper, Space Communications and Navigation [SCaN], Space Launch System [SLS]) especially after the MBSE Pathfinder (2016/2017) and MBSE Infusion And Modernization Initiative (MIAMI, 2018/2019) studies. However, these pilot programs and a survey of NASA's use of MBSE conducted by NASA Independent Verification & Validation (IV&V) and Ames Research Center identified critical challenges and factors of concern, including:

- Sharing and version control of models and information contained in the models.
- Integration of MBSE tools with domain specific tools.
- Steep learning curve for users with limited MBSE experience.
- Testing, verification, and validation with SysML have limited use.
- No tools exist for formally specifying requirements and linking to model properties.

With programs such as Gateway and Artemis that require coordination among multiple NASA centers, international space agencies, and commercial partnerships these challenges will be amplified and should be considered when addressing the scope of this subtopic. Tool infrastructures that enable integrated support of requirements tracing, design reference points, intelligent reasoning of data, and interface constructs are generally not available except within proprietary boundaries. We need tools that support integrated development and model sharing across development environments and that support use across multiple vendors.

Relevance / Science Traceability:

This subtopic would be of relevance to all Human Exploration and Operations Mission Directorate (HEOMD) missions, but of particular interest will be Gateway and Artemis development. Those systems have already adopted the use of MBSE tools and tools sought to help reduce potential system integration bottlenecks. Over the next 3 to 5 years, there will be considerable opportunity for small business contributions to be matured and integrated into the support infrastructure as Gateway evolves from concept to development program. Longer term plans for human exploration, including a sustained lunar presence and manned Mars missions, would benefit from disruptive innovations that improve the entire project life-cycle including mission design, acquisition, development, and deployment.
